Daily Stand-up, Status Updates, and Blockers

How to sound clear, concise, and reliable in remote engineering teams

远程团队里最常见、最实用的工作英语场景之一

Today's Focus

Why stand-up matters
A reliable 3-part structure
Better updates and blocker language

Why This Matters

A daily stand-up is not for storytelling.

It is for alignment.
People need to know where things stand, what happens next, and whether anything needs support.

A good update helps the team answer:

Do we know what this person is doing?
Do we know what they will do next?
Do we know whether they need help?

Common mistakes

Talking for too long
Giving vague updates
Saying “I’m blocked” without context

Key idea

Status
Direction
Risk

The Most Reliable Structure

Use a simple 3-part update every day:

1) Yesterday

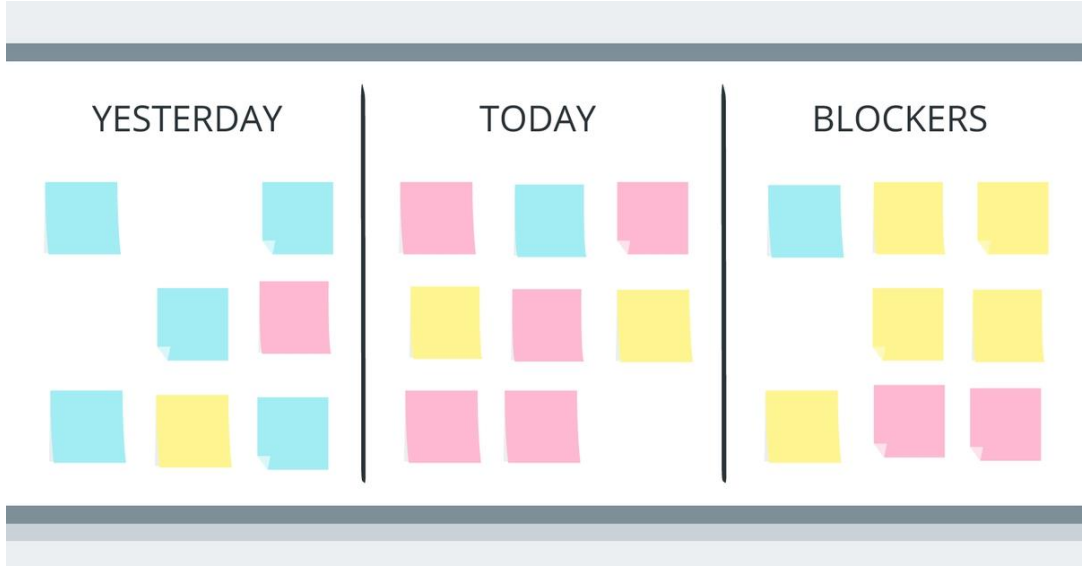
What did I finish, check, or move forward yesterday?

2) Today

What am I focusing on today?

3) Blockers

What is slowing me down? What do I need from others to keep moving?



Short. Predictable. Easy for the team to process.

What Makes a Strong Status Update

Weak update

“I’m checking it.”
“I’m still investigating.”
“I’m working on it.”

Better update

I’m currently reviewing the latest deployment logs, and I’ve already compared the staging config with the previous release.
Next, I’m going to validate whether the issue is related to the retry settings.

A stronger update includes:

1. Current task

What exactly are you working on?

2. Current progress

What have you already checked or completed?

3. Next step

What are you going to do next?

How to Talk About Blockers

A blocker update should answer four questions:

What is blocked?
Why is it blocked?
What do you need?
What can you still do while waiting?

Example

I'm currently blocked on the staging validation because I still don't have access to the monitoring dashboard.
I've already submitted the access request, and while I'm waiting, I'm continuing with the log review and config comparison.

Why this sounds professional

It explains the blocker clearly.
It shows initiative instead of passivity.

中文提示：不要只说 "I'm blocked." 要补充原因、需求，以及等待期间你还能继续推进什么。

Web3 Example

Example 1 — RPC provider issue

Yesterday I looked into the RPC timeout issue and confirmed that the failures were happening intermittently on one of our external providers.
Today I'm comparing the retry settings and checking whether the issue is isolated to a specific endpoint.
The current blocker is that I still need access to the monitoring dashboard to verify the full request pattern.

Example 2 — Indexer lag

Yesterday I checked the indexer lag and confirmed that the delay increased after the latest sync job restart.
Today I'm looking into whether the issue is coming from RPC response time or downstream processing.
The main blocker at the moment is that I still need input from the data side to verify one part of the ingestion pipeline.

Useful vocabulary: RPC instability, timeout, indexer lag, sync delay, provider issue, monitoring access

DevOps Example

Example 1 — Deployment review

Yesterday I reviewed the latest deployment logs and reproduced the issue in staging.
Today I'm validating the Helm config changes and checking whether the rollout strategy is causing the pod restart behaviour.
I'm not fully blocked, but I'm still waiting for confirmation on the updated deployment window from the infra side.

Example 2 — K8s restart pattern

Yesterday I completed the initial review of the Kubernetes events and found that the restart pattern mostly happened after the latest config update.
Today I'm comparing the new config with the previous release and checking whether the probes need adjustment.

Useful vocabulary: deployment logs, staging, Helm config, rollout strategy, pod restart behaviour, dashboard access

Practical blocker line

The current blocker is that I still need read access to one of the dashboards, but while I'm waiting for that, I'm continuing with the deployment review.

Useful Phrases + Final Takeaway

Yesterday

Yesterday I worked on…
I focused on…
I spent some time reviewing…

Today

Today I'm planning to…
My main focus today is…
The next step on my side is…

Blockers

The current blocker is…
I'm still waiting for…
I need input / access from…

To sound more proactive

While I'm waiting, I'm continuing with…
In the meantime, I'm reviewing…
I've already submitted the request.
Once that is confirmed, I should be able to move forward quickly.

Final takeaway: In remote teams, a good update is not the one that sounds busy. It is the one that keeps the team aligned.

中文总结：一个好的 update，要把 status、direction、risk 讲清楚。
